Figure 1C shows the results of the analysis of variance. The interaction between the two factors was highly significant ($F_{1,10} = 10.5$, $p < 0.01$). The interaction was due to the fact that the effect of the concentration of the solution on the rate of the reaction was much more pronounced in the case of the solution containing the catalyst than in the case of the solution without the catalyst. The rate of the reaction in the case of the solution containing the catalyst was about 10 times higher than in the case of the solution without the catalyst at the same concentration of the solution.
